Boosting power beyond the horizon

Leading the way in smart PV and energy storage solutions

01 Company Profile

About us

At TrinaTracker, a business unit of Trinasolar, we specialize in smart mounting systems with a presence on all five continents. Currently, we have accumulated over **20+GW** across more than **700+ projects** worldwide. At TrinaTracker, we offer a comprehensive solution that combines innovation, quality, and technology with the ability to adapt to any scenario and meet the needs of our clients. We are motivated to work towards a more sustainable and just world, where the production of clean energy is not a future goal but our current practice.

Strong R&D and Engineering Team

Innovation hubs in China and Spain
Teams experts
Partnership with world-leading consultants

Reliable & Smart Tracking Solution

Vanguard 1P /Vanguard 2P
Smart Control System (SuperTrack +Trina Smart Cloud+Smart Controllers)

Our leading indicators

10+GW production capacity
20 years of industrial experience
60 countries across 5 continents

Life-cycle Service

Pre-sales engineering, in-sales engineering
In-sales delivery and installation guidance
After-sales O&M services

Development History

1961

- In 1961, Nclave's parent company, Grupo Clavijo, was established as one of the world's first companies to develop and produce PV structures.

1997

- In 1997, Inspired by the "Kyoto Protocol" and the "Million Solar Roofs Initiative of the United States", Trina Solar was founded.

2008

-In 2008, Trinasolar, leading upstream and downstream company, built China's first industrial park named after a company – "Trina PV Industrial Park", which was one of the largest comprehensive industrial parks featuring PV in the world at the time.

2018

- In 2018, Trina solar became the holding company of Nclave through equity acquisition and launched the "TrinaPro" solution in the same year.

2020

- In 2020, Trinasolar issued first A-Shares on Shanghai Sci-Tech Innovation Board, known as STAR Market, becoming the first Chinese PV product, PV system and smart energy company to trade on the STAR Market.Trina Solar acquired Nclave 100% and launched the "TrinaTracker" brand.Trina Solar launched "Vanguard" multi-drive 2P trackers and was awarded the world's first IEC62817 certification.The first corporate research institute specialized in "smart solar tracking systems" in Changzhou was established. Trina Solar was awarded the Qualified Test Lab (QTL) certifica tion from Germanybased SGS.

2022

- New Vanguard 1P Launch,
- TrinaTracker Intelligent System Upgrade,
- Smart Control System Solution Launch.

2023

By the end of 2023, TrinaTracker has delivered more than **20GW**

mounting structure system. TrinaTracker had launched the new generation of Vanguard 2P with multi-motor systems worldwide in online format.

2024

- New Upgraded version Vanguard 1P

- New version of TrinaSmartCloud

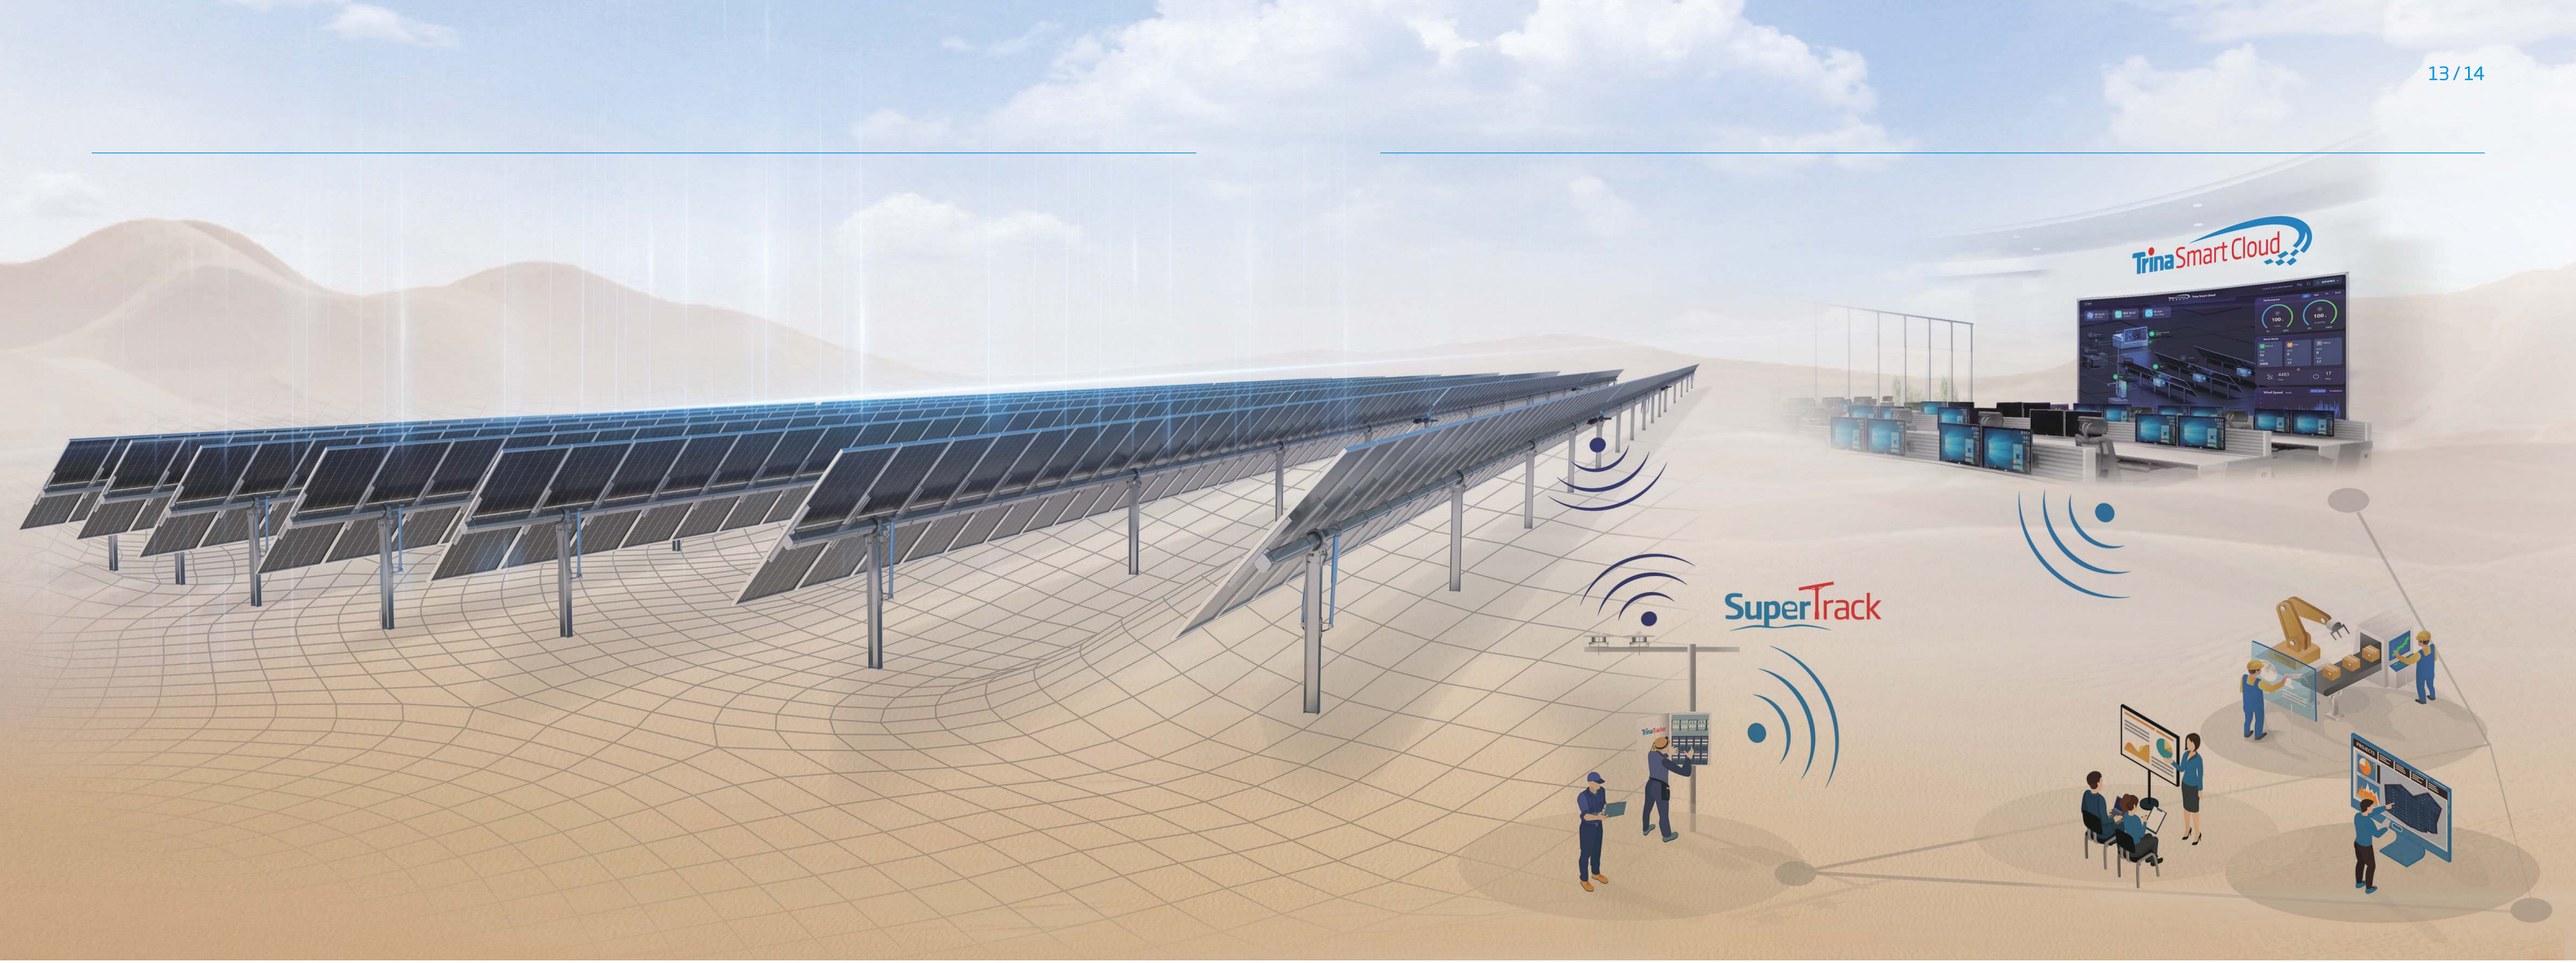
Manufacturing Leadership

The smart solar tracker factory featuring innovation, reliability and intelligence demonstrates the industry advantages of TrinaTracker. By leveraging advanced manufacturing equipment, the Production + Research platform, and the life cycle quality management concept, TrinaTracker actively creates industry-leading tracker products.

TrinaTracker will further fully integrate and utilize hardware and software to realize intelligent manufactur ing scenarios integrating intelligent production, coordinated decision-making, intelligent IoT, planning collaboration, and quality control. Meanwhile, it will use intelligent approaches to de ne product paths and business scenarios, identify customer needs and product con gurations, and continue to optimize the use of sites while allowing for restrictions to continuously improve value and energy yield for clients and achieve win-win cooperation.

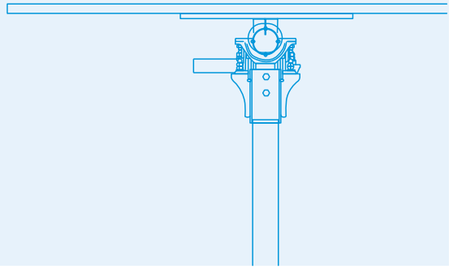


TrinaSmart Cloud
SuperTrack

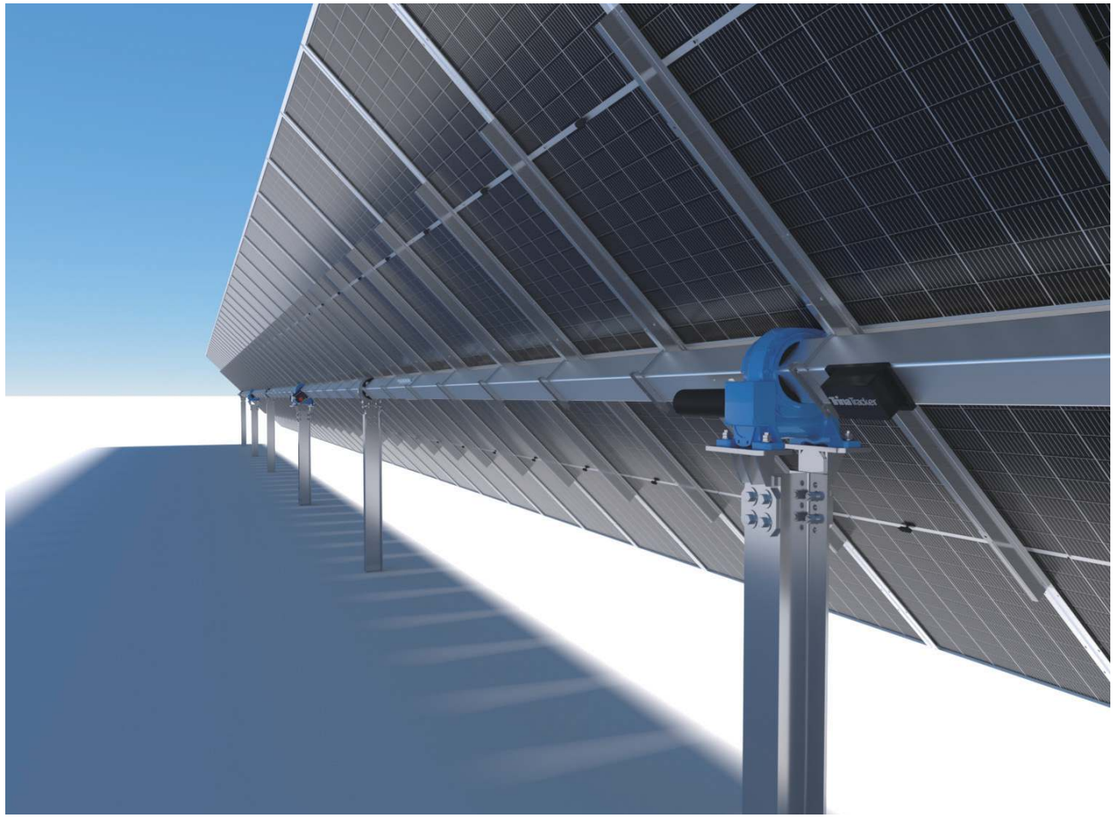
Vanguard 1P

Single row - 1 in portrait - single-axis tracker

- 1 in portrait, ultra compatible with 700W+ module
- Optimized terrain adaptability: 15% N/S E/W
- Tracking range: ±60°
- Cleaning robot solution for easier O&M
- Quick installation design, reduce the installation costs by up to 19%
- Flexible wind protection strategies
- Innovative snow & hail protection

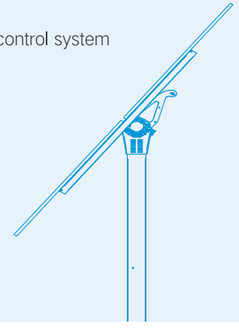


Vanguard 2P



Single row - 2 in portrait - single-axis tracker

- 2 in portrait, specially designed for ultra-high-power modules up to 700W+ with electrification control system for greater stability.
- Up to 120 modules per tracker
- Optimized terrain adaptability up to 15% N/S
- Tracking range ±60°
- Less pile design for lower BOS in difficult scenarios of piling.
- Best for challenging sites such as irregular layout, undulated terrain, and high wind regions
- Independent row design for easier accessibility of O&M vehicles



Trina Smart Cloud monitoring platform: integration of functions such as real-time monitoring, fault alarm, precision control, meteorological data sharing, log data recording, and data forwarding, empowering the plant cost reduction and efficiency increase.

TrinaSmart Cloud

Smart O&M

Improve power generation efficiency

Reduce LCOE

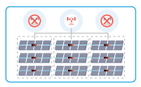
1

Monitoring & recording & forwarding

- Dynamically monitor the operating status of trackers
- Store key information of trackers
- Transfer the data to the power station monitoring platform

2

Meteorological data sharing



- Share meteorological data such as wind speed and irradiance
- Reduce the number of sensors
- Reduce power generation loss caused by sensor operation and maintenance

3

Multi-level system protection

- Multiple system safeguards ensure that running data would not lost

4

Safety guarantee

- Access multi-role permission management
- Log management enables historical traceability
- Grant diversified operation permission
- Hierarchical precision management

Intelligent and accurate operation and maintenance

- Dynamically monitor the operating status of trackers
- Real-time fault alarms
- Key parameter analysis
- Motor diagnostic and pre-warning

Precise and intelligent control

- Running data query
- Control trackers operation mode& target angle
- Set trackers parameters individually & in groups

Reduce power generation loss

- Share meteorological data between NCUs
- Reduce power generation loss caused by sensor fault and O&M

Digital map positioning

- Precisely locate the position & status of each tracker
- Status display & positioning of key components of trackers
- 3D digital modeling dynamic display of trackers layout and status

System security and stability

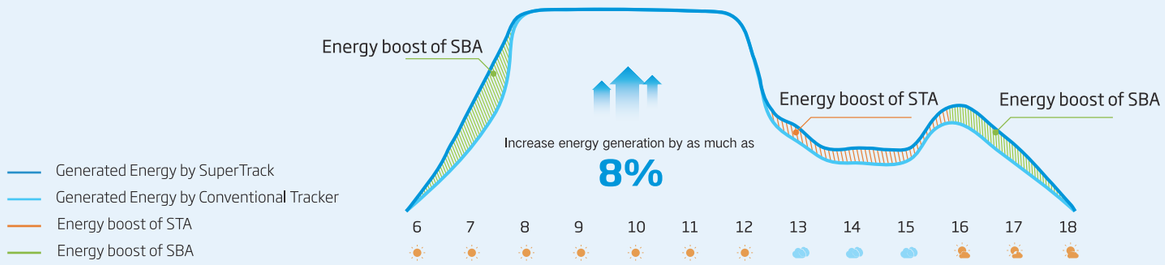
- Multi-role permission management
- Network security
- Hardware & software security and stability

Smart Tracking Algorithm (STA&SBA)

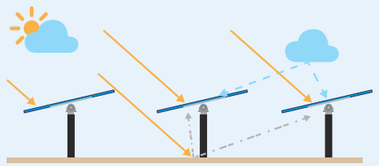
SuperTrack

TrinaTracker has developed the smart tracking technology - SuperTrack, which includes smart algorithms（STA&SBA）, multi-source data and a patents model.

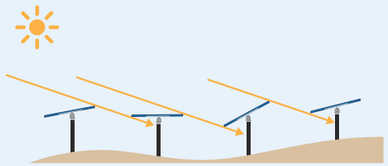
SuperTrack can calculate the optimal power generation angle of the bifacial module in real time for different weather conditions, and identify the characteristics of the complex terrain in an intelligent way, independently optimize the angle of backtracking in each row, avoid row-to-row shading, and fully optimise the power generation potential of tracker. Compared with conventional tracking algorithm, boosting energy generation by as much as 8%.



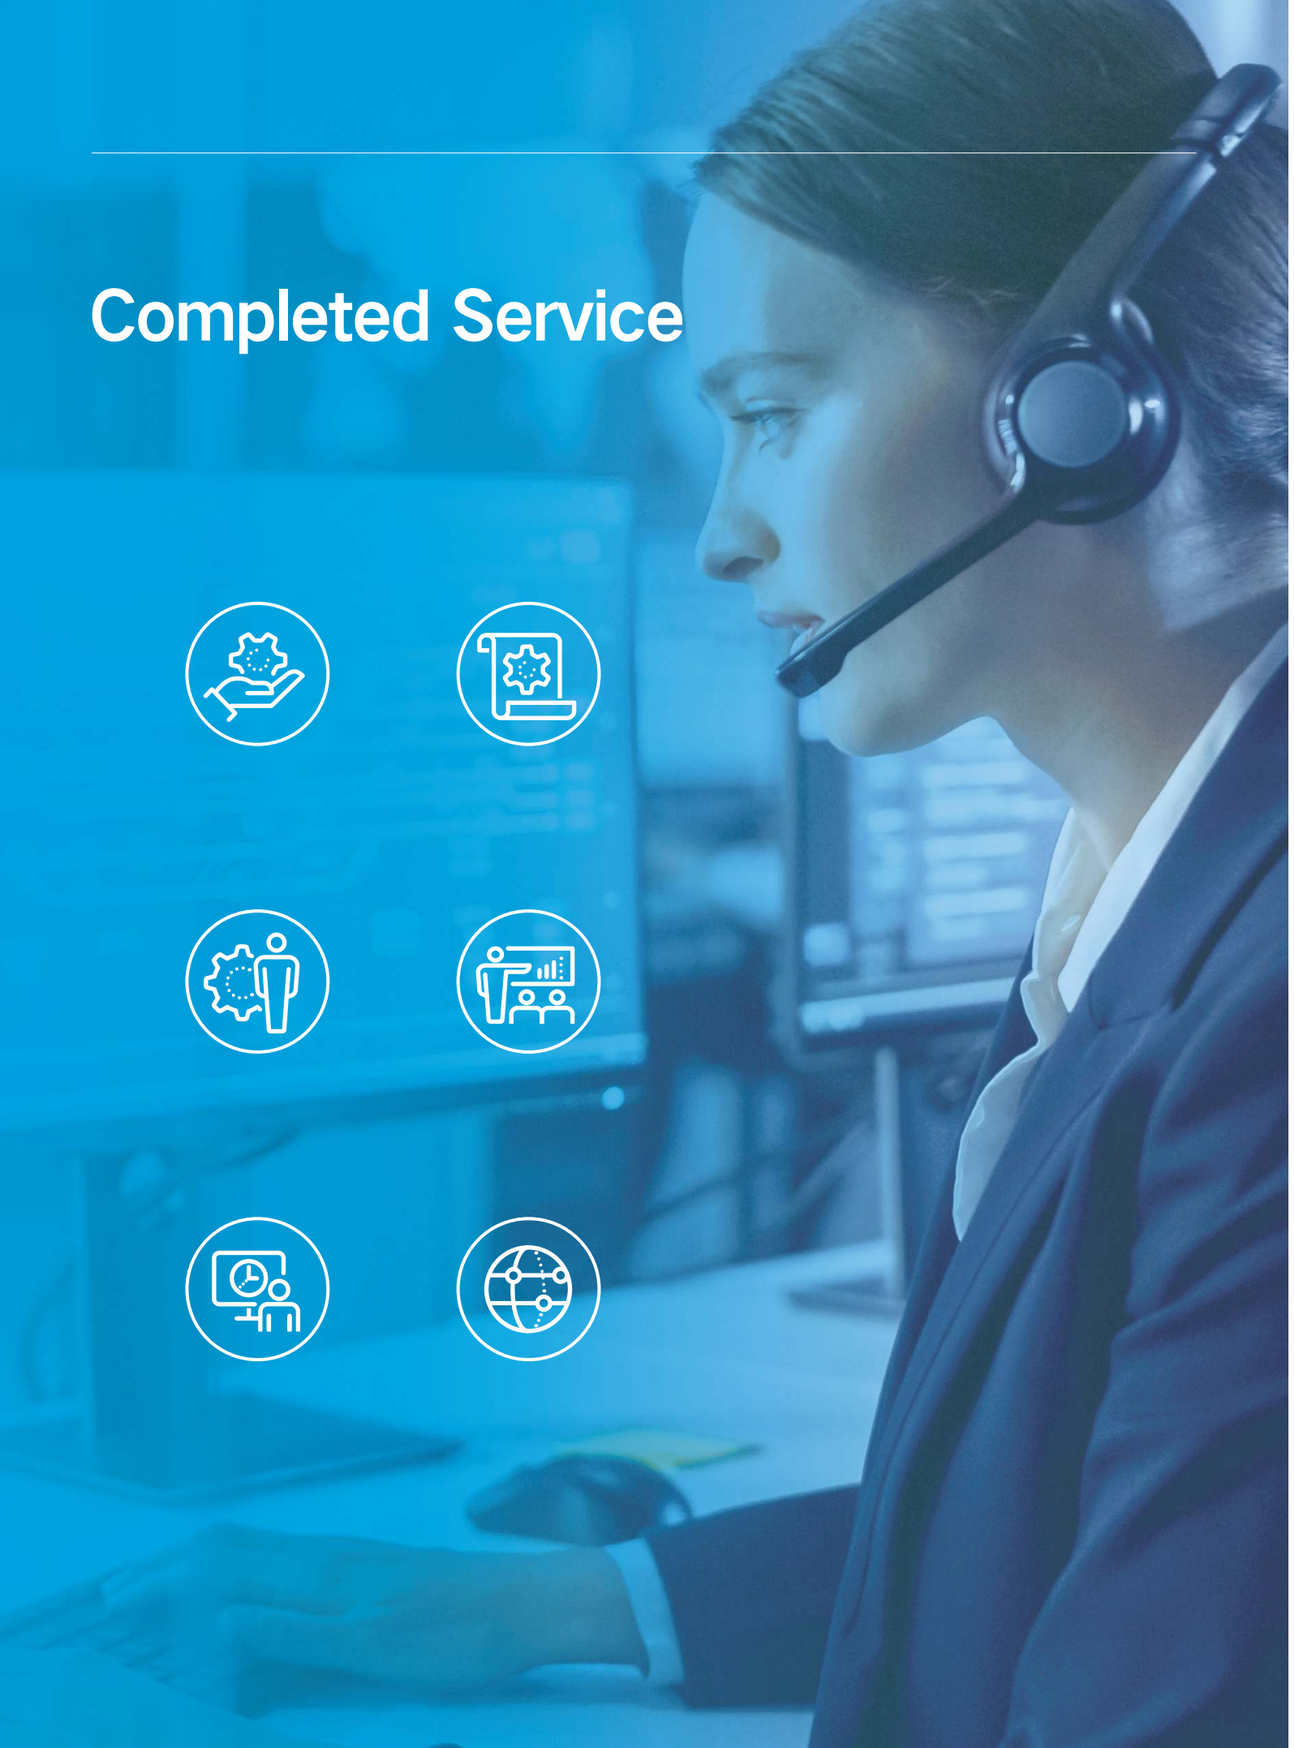
STA algorithm



SBA algorithm



Completed Service



Pre-sales

Pre-sales design/pull-out test

- Guidance on the design and implementationof pull-out tests
- Final design of pile foundationWe assume the risks for pile foundation designwith assurance
- International geological survey consultants
- Installation feasibility assessment

Engineering

Detailed engineering design

- Layout optimization
- Complete construction drawings
- Technical FAQ

Project Management

On-site installation management & services (optional)

- Installation process and instruction manual preparation
- On-site installation training
- Subcontractor certification
- Schedule optimization and risk management
- On-site material management
- Installation guidance (steps, tools, etc.)
- Installation quality control
- Structural and module installation
- Electrical installation
- Driving of pile

Commissioning

Commissioning

- Material checklist and preparation
- Deficiency elimination
- Remote commissioning, data monitoring
- Training and on-site guidance

After-sales

After-sales service

- Customer response within 24 hours
- Providing after-sales solutions within 15 days
- Immediate remote guidance for system commissioning
- Visualized after-sales service process
- Performance validation to ensure stable and efficient operation
- Assistance in purchasing spare parts, installation and commissioning
- SCADA monitoring and O&M recommendations for high efficiency

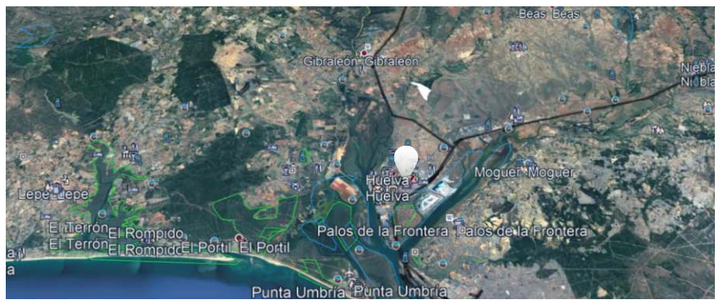
Service center

- China: Changzhou, Shanghai
- Europe: Madrid, Spain
- Australia: Melbourne
- USA: Albuquerque
- South America: Brazil, Chile

03
Case Study

50 MW
Huelva, Spain

- **Site** / Huelva, Spain
- **Capacity** / 50MW
- **Owner** / GES
- **Tracker type** / SP240（(Agile series)
- **Module** / LONGi LR4-72HBD 425-455M



Project Information

The Huelva 2021 Solar Power Plant is a park with an installed capacity of 50MW. Two specs of SP240 trackers (predecessor of Agile 1P), namely 1Px56 and 1Px28, were installed to suit the needs of different terrains. More than one hundred thousand PV panels were installed in the park, with an annual capacity of 100 GW · h, equivalent to the consumption of 28,000 households in Spain.

Site Description

(Provincia de Huelva) is a province of southern Spain, in the western part of the autonomous community of Andalusia. It is bordered by Portugal. Huelva is known as the sunniest city in Spain. Thanks to the excellent light conditions, the city has become a hot spot for investment in PV plant. But Huelva was not an ideal location for the operators in terms of preliminary foundation construction. According to the investigation, although located in the coastal area, Huelva is close to the mountains, while rivers are densely distributed, resulting in complicated geological conditions with slopes.

Project Challenge

Huelva is the first project to use the Agile series trackers. One of the challenges encountered by the operators during the engineering phase was that the slope of the trackers should be increased to 8% to meet the technical specifications for ground slopes higher than the maximum design slope (5%). On the other hand, due to the geotechnical characteristics of the project area, longer piles were required to ensure the stability of the tracker foundation.

TrinaTracker Solution

To avoid additional earthworks by the client, TrinaTracker’s staff repeatedly reviewed and modified the project to enhance the properties of some mechanical parts of the trackers. In addition to product supply, TrinaTracker made a great effort to offer professional service during the delivery process, sending a technical team on site for installation guidance and tracker commissioning. This ensured timely commissioning and successful operation of the systems.

Owner Testimonials

“We’re quite impressed by the professional service offered by TrinaTracker all the way from delivery to on-site installation, and the reliability of product itself. We look forward to working with TrinaTracker again for the upcoming projects,” explained Mr. José Luis Morlanes Galindo, CEO of Alter Enersun that owns the Huelva project. For the solar power plant, solar trackers provided by TrinaTracker have proven to run at high efficiency since its commissioning in summer 2021. No complaints have been received since the start of construction, fully proving the outstanding quality of the Agile series trackers.

400MW
Nangong, Hebei Province

Site / Nangong, Xingtai, Hebei Province
Installed capacity / 400MW
Owner / Guosun New Energy
Contractor / PowerChina Jiangxi Electric Power Construction Co., Ltd.
COD / 2020.12
Tracker type / Vanguard-2P
Module / Vertex 550W

Project Information

On December 30, 2020, the GuoShun 400MW PV agricultural project was successfully connect to the grid. The project is equipped with TrinaTracker Vanguard-2P trackers and 210mm Vertex modules. The successful grid connection of the Nangong project once again proved that TrinaTracker is the only company in the industry that can supply the package of "modules + trackers".

Site Description

Nangong is one of the 19 counties/county-level cities/districts under the jurisdiction of Xingtai, Hebei Province. The county-level city is named after Nangong, one of the eight sages of the Western Zhou Dynasty. Known as the revolutionary base in Southern Hebei Province, Nangong is located in the southern part of the Hebei Plain with flat terrain. The famous Battle of Julu in ancient China took place nearby. Nangong is renowned for its animal husbandry and agriculture. It has been awarded the titles of "National High Quality Cotton Production Base", "Shorn Sheepskin Capital of China", etc. The Nangong project is located in more than 40 unincorporated villages. From the air, you can see numerous modules and trackers are dotted all over Nangong, like sapphire inlaid in the golden earth, which are truly breathtaking.

TrinaTracker's Advantages

The Nangong project uses Vanguard-2P for the first time in China. Compared with 1P trackers, 2P trackers need to accommodate more PV panels in a limited land area. Therefore, they should have higher bearing capacity and better wind resistance with a more complex structure. Therefore, a multi-drive system is innovatively used in Vanguard-2P to deal with structural failures. Patented spherical bearings reduce additional stress and the rate of component failures caused by system deformation. The self-developed controller and the Smart Tracking Algorithm can monitor wind speed in real time and adjust the best wind resistance angle to maximize the protection of trackers and modules from strong winds.

Measured Data

In terms of irradiance, previous data show that, with the common solution, the number of hours when light is effectively utilized in three years is less than 1,250h on average. Thanks to the adoption of Trina's bifacial modules, the number of hours when light is effectively utilized in three years can be increased to no less than 1,350h. TrinaTracker's intelligent algorithm further optimizes the power generation efficiency of bifacial modules, improving it by 9% on the original basis. The number of hours when light is effectively utilized in three years can reach about 1,480h, significantly improving the owner's earnings.

25MW
Taung Daw Gwin Myanmar

Site / Kyaukse, Myanmar
Capacity / 25MW
Owner / China Construction Machinery
Tracker type / Vanguard-1P
Module / Trina TSM-DEG19C.20

Project Information

Myanmar is an agricultural country with an underdeveloped industry. Kyaukse City in Myanmar suffers from severe power shortages, with power outages once an hour on average every day. The estimated power output of the photovoltaic power station is 45,000,000 kwh, accounting for 14% of the annual local electricity consumption; 120,000kwh is generated during the day, accounting for 29% of the electricity consumption during the day, which greatly alleviates the difficulty of local electricity use.

Site Description

The Taung Daw Gwin project site is located in the mountains of central Myanmar and has a tropical monsoon climate with abundant rainfall. The central region is prone to rainfall in August and September, and Myanmar is one of the 10 countries that are worst affected by climate change from 1990 to 2008. Over the past 18 years, cyclones and floods have brought huge losses to Myanmar. The ground clearance and wind resistance conditions should be considered for the construction of the power station.

Project Challenge

This project is the second photovoltaic project of the Burmese owner. The first 30MW project adopts the products of another Chinese manufacturer, and many control boxes of this manufacturer have burnt out or become uncontrollable. Therefore, the owner inquired many times from delivery to installation to commissioning and had doubts about the pass rate of the control box.
The workers hired by the project are basically local villagers who live on farming and are unfamiliar with the mounting brackets and even the types of bolts and nuts, so there is some difficulty in installation.
Myanmar is prone to floods and cyclones, and the brackets need to cope with extreme weather.

TrinaTracker Solution

We emphatically introduced the advantages of TrinaTracker TCU during the technical guidance, and during the commissioning process, we introduced the use of the software to the customer’ s technicians, and answered some questions left by the customer about the control box.

During the installation process, we made detailed technical disclosures to the owner's technicians, and arranged special workers to pre-assemble each component in the material warehouse, reducing the work complexity of bulk materials on site, so that the installation could be completed smoothly.

Owner Testimonials

TrinaTracker provided the customer with one-stop system integration solutions covering design, construction, operation and maintenance. In the ending stage of the project, the customer sent a letter of appreciation to praise TrinaTracker for communication and coordination, installation guidance, scheduling, epidemic prevention, and safety management on the site. The customer was deeply impressed by the professional quality of our staff, and sincerely hoped to cooperate with TrinaTracker and create brilliant future together with TrinaTracker in the future.
